- 29) [URGENT CARE CENTRE \(PRUH\)](#)
- 30) [Vaccinations](#)

This formulary is to be adhered to by all staff and contractors of Bromley Healthcare.

It should be taken fully into account when prescribers are exercising their clinical judgement. However, this does not override the responsibility of prescribers to make decisions based on the individual patient appropriate to their circumstances.

It is intended to cover :

- Prescriptions written
- Stock in clinic

BNF 1 Gastro-Intestinal System

Antacids and alginates- Alginate containing products have low acid suppressant activity and should be reserved for patients with reflux symptoms - Mucogel® (low sodium)

(1.5) Chronic bowel disorders- aminosalicylates and corticosteroids

Mesalazine (prescribe by brand. If 400mg MR formulation required, use Mesren MR® brand)

Where a PPI is indicated the LOWEST EFFECTIVE DOSE should be prescribed. Currently it is estimated that 25-50% of all PPI prescriptions are inappropriate

Laxido is better value, however when using with thickeners for dysphagic patients Movicol is preferred

BNF 2 – Cardiovascular system

Doxazosin (standard preparations) –Not to be used 1st or 2nd line for hypertension

Angiotensin II receptor antagonists (ARB) –

Losartan 1st choice for hypertension or diabetic nephropathy due to cost differential. Also in older patients due to lower incidence of postural drop

Candesartan ARB of choice in heart failure. Titrate to 32 mg or max tolerated dose. Valsartan licensed for LV dysfunction post MI

Note : neither Candesartan nor Valsartan are licensed to treat diabetic neuropathy

ARBs have poorer outcome evidence than ACEi and should be reserved only for those patients who suffer from unacceptable side effects using ACEi. ARB is not recommended if patient has suffered angio-oedema on an ACEi

Spirolactone may be used for specific indications such as heart failure, ascites, hypertension, nephrotic syndrome, primary hyperaldosteronism. Eplerenone may be used in the management of chronic heart failure (NYHA class II). Careful monitoring for hyperkalaemia and hypovolaemia is required especially for people taking other diuretics and/or ACE inhibitors

Anti-platelet drugs-

Aspirin - Use post MI or post stroke if clopidogrel not tolerated. EC use is not recommended

Clopidogrel - For prevention of all other occlusive vascular events (with aspirin for 12 months post ACS), in multivascular disease, or post MI if aspirin not tolerated

If PPI cover is needed for patients on clopidogrel, lansoprazole is preferred. Other gastrointestinal therapy such as H2 blockers (except cimetidine) or antacids may be suitable in some patients
For further guidance on stroke see -

<http://www.nice.org.uk/nicemedia/pdf/CG68FullGuideline.pdf>

Asasantin Retard® (to aid compliance) - Use only post TIA or if other antiplatelets aren't tolerated

Statins-

Simvastatin- First line statin in ALL patients except ACS. Must be given in evening or at night due to short half life.

Atorvastatin- First line statin in patients with ACS. Atorvastatin 80mg recommended in patients with confirmed Acute Coronary Syndrome until 1 year after last event in line with Clinical Threshold Policy. SEL cardiac network guidelines available from:

<http://www.slcsn.nhs.uk/prescribing.html>

Ezetimibe - (according to NICE TA & SLCSN guidance) Consider for patients C/I for Statin or that can't tolerate a statin

This drug is expensive and should **only** be used when

- * Patient is unable to tolerate any statin at any dose.
- * Patient has familial hypercholesterolemia and is on maximum tolerated statin
There is no outcome data to support the use of this drug (Ezetimibe).

Omacor® capsules 1g - For hypertriglyceridaemia only

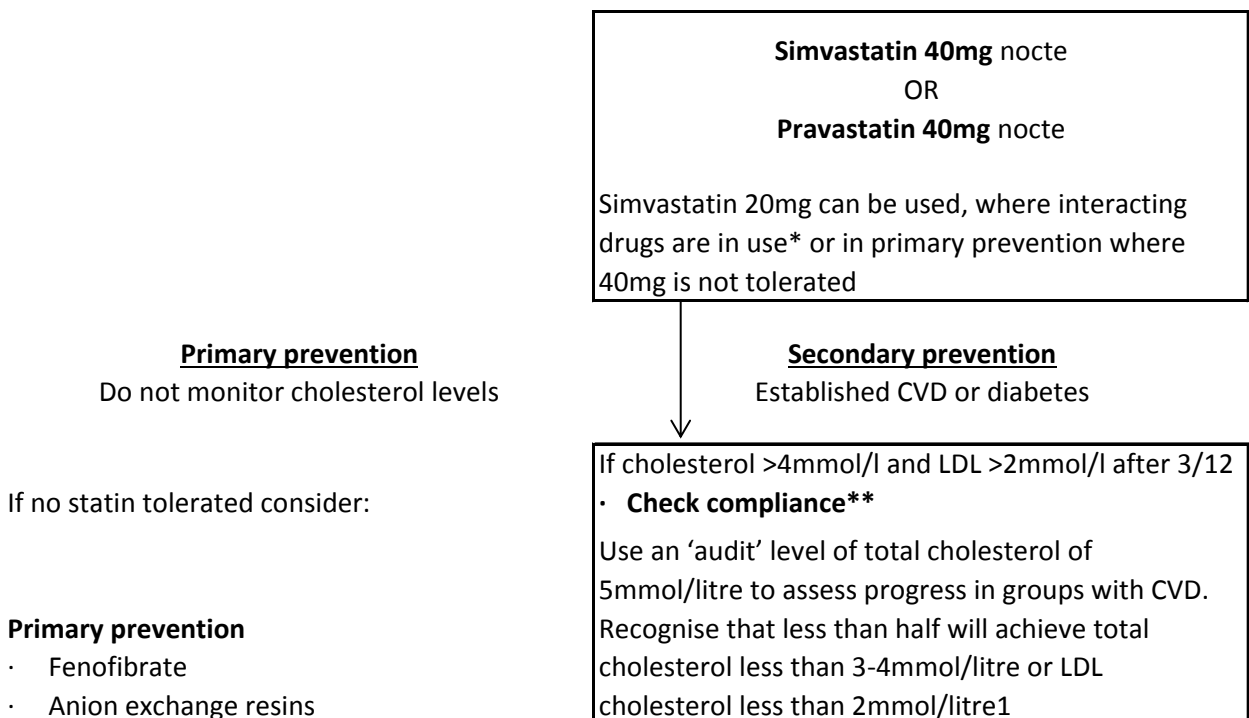

Fenofibrate - Similar efficacy to bezafibrate in the reduction of triglycerides and is more potent than in terms of LDL reduction and HDL elevation.

Pravastatin- guidelines available from:

<http://www.slcsn.nhs.uk/prescribing.html>

Lipid Modification Guideline

Compliance with therapy must be achieved before escalating therapy**

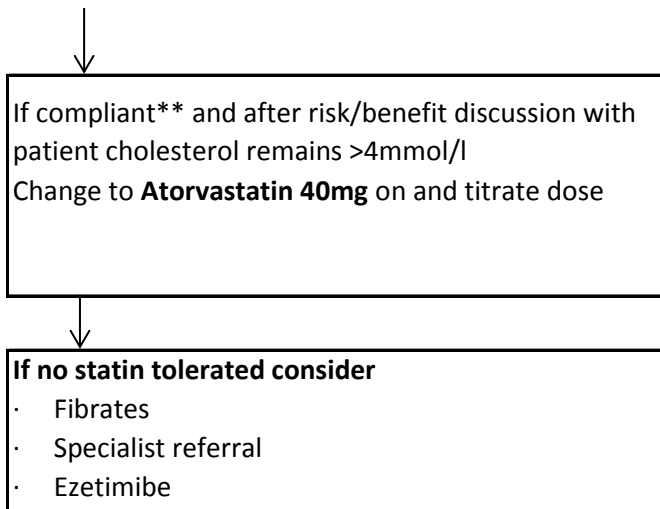

For treatment of pure primary non-familial hypercholesterolemia

- Ezetimibe may be considered after lifestyle measures have been optimised

LFT checks with statins

Only at baseline, 3 & 12 months – Unless clinical concern present (NICE)

BNF 3- Respiratory System

Inhaled corticosteroids – eg Beclometasone, prescribe by brand e.g. Clenil® or Qvar®

The MHRA (2006) advised that beclometasone cfc-free inhalers should be prescribed by brand name e.g. Clenil Modulite® and Qvar® are not interchangeable. Qvar® has extra fine particles and is approximately twice as potent as Clenil Modulite® 100mcg Qvar should be prescribed for 100mcg fluticasone, 200-250mcg beclometasone dipropionate (or Clenil Modulite®) or budesonide.

MHRA (2007) advised vigilance for the development of pneumonia and other LRTI (i.e. bronchitis) in patients with COPD. If treated with drugs that contain steroids as clinical features of such, infections and exacerbations can overlap. Any patient with severe COPD who has had pneumonia during treatment with inhaled steroids should have their treatment reviewed.

Long-acting beta agonists (LABA).- Formoterol, Salmeterol

They should not be used without concomitant steroid dosing and should not be initiated in patients with rapidly deteriorating asthma.

Beclometasone+ formoterol (Fostair® ▼) (licensed for adults > 18years) Fostair® has extra fine particles and is more potent than traditional beclometasone CFC free inhalers.

Asthma

Fostair is indicated in the regular where use of a combination product (inhaled corticosteroid and long-acting beta₂-agonist) is appropriate:

- patients not adequately controlled with inhaled corticosteroids and 'as needed' inhaled rapid-acting beta₂-agonist or
- patients already adequately controlled on both inhaled corticosteroids and long-acting beta₂-agonists.

COPD

Symptomatic treatment of patients with severe COPD (FEV₁ <50% predicted normal) and a history of repeated exacerbations, who have significant symptoms despite regular therapy with long-acting bronchodilators.

Relvar Ellipta: combination inhaler for asthma and COPD

Relvar Ellipta (vilanterol/fluticasone furoate) is a new fixed-dose combination inhaler for asthma and COPD.

In asthma patients fluticasone furoate 100 microgram once daily is approximately equivalent to fluticasone propionate 250 microgram twice daily.

The dry powder inhaler is indicated for regular treatment of asthma where a long acting β 2-agonist (LABA) and an inhaled corticosteroid is appropriate. It is also indicated for the symptomatic treatment of COPD in patients with a post-bronchodilator FEV₁ < 70% predicted and a history of exacerbations despite regular bronchodilator therapy.

Elira Genuair: new long-acting anticholinergic for COPD

Eklira Genuair (aclidinium bromide) is the second inhaled long-acting anticholinergic to be licensed for the maintenance treatment of COPD.

Aclidinium bromide is a competitive muscarinic receptor antagonist. The metered dose of aclidinium bromide from the Genuair inhaler is 400 micrograms, which corresponds to a delivered dose of 322 micrograms of aclidinium per inhalation.

Onbrez Breezhaler (indacaterol): New LABA inhaler for COPD

It is a dry-powder inhaler containing a novel long-acting beta agonist for COPD.

Fluticasone (Flixotide®) is not included in the formulary for the following reasons:

- British Thoracic Society (BTS) guidelines suggest that there is little to choose between the efficacies of the available steroid preparations.
- Relatively large numbers of adverse reactions (including fatalities) have been reported with fluticasone. The CSM has issued two specific safety warnings regarding fluticasone safety.
- NICE TA 138 (Asthma (in adults) – corticosteroids) recommends use of the least costly product that is suitable for an individual, within its marketing authorisation. NICE TA 131 (Asthma (in children) – corticosteroids) recommends use of the least expensive product that is suitable for the individual child.

Theophylline - Prescribe by brand name and only as a last resort.

BNF 4 –CNS**Hypnotics**

NB AVOID repeat issue, consider first prescription maximum of 7 days only

Zopiclone 1st line , **Temazepam 2nd line**

See BNF guidance on recommended maximum period of treatment and dose reduction where appropriate

Anxiolytics

NB AVOID repeat issue, consider first prescription maximum of 7 days only

Lorazepam 1st line, Diazepam 2nd line (Caution: very long half life).

Anti-manic drugs

Follow guidance from specialist in mental health as not initiated in primary care. Continuation of prescribing under shared care arrangement is appropriate

Lithium (prescribe by brand to assure consistent bioavailability)

Antidepressants:

NICE guidance Depression in adults:

<http://guidance.nice.org.uk/CG90>

Tricyclic and related antidepressant drugs -Not recommended first line for depression (use SSRI instead) but remains an option for neuropathic pain and migraine

Selective serotonin reuptake inhibitors - For depression, mixed anxiety disorder:

Citalopram is licensed for treatment and maintenance therapy for depression and for panic disorder. Citalopram is associated with dose-dependent QT interval prolongation and the maximum daily doses should be restricted to 40 mg for adults; 20 mg for patients older than 65 years; and 20 mg for those with hepatic impairment

Fluoxetine is licensed for depression, OCD and bulimia, has a long half life and has a higher propensity for interactions. 60mg capsules are more expensive than 3x20mg

Discontinuation reactions are highest with Paroxetine and lowest with fluoxetine

Only fluoxetine has been shown in trials as effective in treating depressive illness in adolescents however the risk of self harm and suicidal thoughts must be monitored.

Venlafaxine is licensed in treatment and prevention of relapse/recurrence of depression, and in XL form for treatment of GAD and social anxiety disorder. Discontinuation syndrome is common and BP is increased at higher doses. It should be avoided in patients with a high risk of cardiac arrhythmia. Use cheapest form which may be branded generic

Analgesics:

Avoid effervescent versions of **Paracetamol** and co-analgesics -particularly in patients with cardiovascular disease, renal disease or hypertension, as a standard dose of effervescent analgesic contains about 8gms of salt. Paracetamol capsules are nearly twice as expensive as tablets

Analgesia in palliative care: **Oxycodone** 2nd line (where Morphine is not tolerated). Oxycodone efficacy and side effect profile similar to morphine. Used primarily for control of pain in palliative care. May be of use for acute pain management in the renally impaired where accumulation is a risk.

Fentanyl patches useful if oral route impaired, renal impairment or intractable constipation due to other oral strong opioids. Not suitable for management of acute pain / unstable pain

Prescriptions for strong opioid medicines should include the brand of the product. Also please see NPSA alert on: Reducing dosing errors with opioid medicines – NPSA 2008

Neuropathic pain (Please note NICE guidance currently under review) Pregabalin should only be prescribed if other first choice options and subsequent gabapentin are contra-indicated, intolerant or ineffective. Regular review should assess on-going effectiveness

Antiepileptics: NICE guidance recommends that the anti-epileptic drugs (AEDs) should be prescribed by brand name where appropriate for treatment of Epilepsy

Drugs used in parkinsonism and related disorders: All drugs must be initiated by a specialist. The NICE guidance on Parkinson's Disease (PD) 2006 states it is not possible to identify a universal first-choice drug therapy for people with PD. The choice of drug first prescribed should take into account:

- clinical and lifestyle characteristics
- patient preference, after the patient has been informed of the short- and long-term benefits and drawbacks of the drug classes.

NICE CG35 Parkinsons Disease

Brand prescribing may be considered where it is felt differences in appearance of a medication may cause a patient anxiety or where familiarity with a particular product in a particular device is important e.g. with apomorphine

Drugs used in substance dependence: Cigarette Smoking Therapy is chosen according to the smoker's likely compliance, availability of counselling and support, previous experience of smoking cessation aids, contra-indications and adverse effects of the products and smokers preference.

[PH10 Smoking cessation services: guidance - NICE Guidance](#)

The use of nicotine replacement products in an individual who is already accustomed to nicotine introduces few new risks. It is widely accepted that there are no circumstances in which it is safer to smoke than to use NRT. Some patients benefit from having more than one type of NRT prescribed

The combination of NRT with varenicline or bupropion is not recommended

MHRA / CHM advice; Suicidal behaviour and varenicline. -

<http://www.mhra.gov.uk/Safetyinformation/DrugSafetyUpdate/CON087901>

Patients should be advised to discontinue treatment and seek prompt medical advice if they develop agitation, depressed mood or suicidal thoughts. Patients with a history of psychiatric illness should be monitored closely while taking varenicline.

[Varenicline for smoking cessation Guidance TA123 - NICE Guidance](#)

– states that varenicline is recommended as an option for smokers who have expressed a desire to quit smoking. Varenicline should normally be prescribed only as part of a programme of behavioural support.

Drugs for Dementia:

[TA217 Alzheimer's disease - donepezil ... - NICE Guidance -](#)

donepezil, galantamine, rivastigmine and memantine. **Following specialist initiation only**

ADHD:

Lisdexamfetamine is recommended for use in South East London for the treatment of ADHD in children aged 6 and over as an alternative to either atomoxetine or dexamfetamine in patients who are unresponsive to a maximum tolerated dose of methylphenidate.

Initiation is by specialists in childhood or/and adolescent behaviour disorder with transfer to primary care after at least 3 months if a patient responds to therapy and is stable, in line with an approved SEL shared care guideline.

It should be used in line with the NICE CG72 for ADHD, positioned as an alternative to atomoxetine or dexamfetamine.

Current interim advice from the Home Office and the Royal Pharmaceutical Society is that it should be treated as a Schedule 2 Controlled Drug, the same as dexamfetamine and methylphenidate.

Atomoxetine is not treated as a Controlled Drug

Clonidine -this is what NICE guidelines quote:

In children and young people whose ADHD is unresponsive to methylphenidate, **atomoxetine** and **dexamfetamine**, further treatment should only follow after referral to tertiary services. Further treatment may include the use of medication unlicensed for the treatment of ADHD (such as **bupropion**, **clonidine**, **modafinil** and **imipramine**)

Melatonin- This is only used in cases of children with neurodisability

The antimicrobial guidelines say that broad spectrum antibiotics including Cephalosporins and Quinolones have been linked to Clostridium Difficile Associated Diarrhoea (CDAD) and should be avoided where possible. They should be reserved for use in the very following restricted circumstances outlined in the guidelines.

Oral Cephalosporins :

- treatment of cystitis in pregnancy - 3rd line choice, Cephalexin or Cefadroxil (caution in those with a penicillin allergy)
- Gonorrhoea - Cefixime 400mg stat (Also applies to pregnancy)

Quinolones :

- Acute Otitis Externa (AOE) : Swimmer's ear may require Ciprofloxacin (adults only)
- Pyelonephritis: in Penicillin allergic patients, consider Ciprofloxacin (adults only) 500mg twice a day for 14 days if mild symptoms
- Acute Prostatitis : Ciprofloxacin 500mg twice a day for 4 weeks
- Human/Animal Bites (adults and children) – severe infection in Penicillin allergic patients : Clindamycin four times a day plus Ciprofloxacin (adults) twice a day.
- Gonorrhoea : Ciprofloxacin 400mg single dose .

Quinolones should be used in caution in patients with a history of epilepsy or conditions that predispose to seizures.

CSM Advice: Tendon damage (including rupture) has been reported in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone

Broad Spectrum Penicillins -

Following the CSM warning Co-amoxiclav is only recommended as first line treatment in specific indications. The risk of liver toxicity is 6 times greater with co-amoxiclav than with amoxicillin. Cholestatic jaundice is more common in patients over the age of 65 and in males. The duration of treatment should not usually exceed 14 days

Macrolides -

Clarithromycin is an acceptable alternative in those who are unable to tolerate erythromycin because of side effects. An alternative to erythromycin in the treatment of community acquired pneumonia and in the treatment of many skin and soft tissue infections is doxycycline.

The HPA recommends clarithromycin as it has less side-effects than erythromycin, greater compliance is used twice rather than four times daily & generic tablets are similar cost.

Azithromycin 250mg capsules to be used normally, 500mg tablets only used for treatment of

Urinary tract infections - Nitrofurantoin should not be used in patients with renal dysfunction because of the risk of peripheral neuropathy

BNF 6 – Endocrine System

Awaiting update once relevant information is received from Croydon CCG

Key points:

<p>Metformin</p>	<p>Currently the only oral therapy with patient outcome data:</p> <ul style="list-style-type: none"> ▶ Standard tablets should be considered the first line therapy in all patients with type 2 diabetes unless contraindicated. ▶ Sukkarto SR (please prescribe this brand only): Reserve for patients with proven intolerance to standard metformin or concordance issues. Reminder: titrating slowly reduces risk of GI side effects
<p>Sulphonylureas</p>	<p>Should still be considered as the initial 2nd line therapy unless patient at significant risk of hypoglycaemia or obesity related illness.</p> <ul style="list-style-type: none"> ▶ Gliclazide MR 30mg: Reserve for patients with concordance issues. ▶ Gliclazide 40mg tablets: More cost-effective to prescribe gliclazide 80mg tablets which are score and can be halved
<p>Pioglitazone</p>	<p>Available generically, potential cost savings can be made if patients are suitable for this 3rd line agent</p> <ul style="list-style-type: none"> ▶ Review current patients on pioglitazone for heart failure and osteoporosis risk ▶ Bladder cancer risk <p><i>(see MHRA Aug 2011 for full article)</i></p> <ul style="list-style-type: none"> ▶ Stop pioglitazone in patients who do not respond adequately to treatment (e.g. reduction in HbA1c). ▶ Use in elderly patients should be considered carefully before and during treatment as risk of bladder cancer increases with age. Elderly should be started on lowest possible dose and regularly monitored because of risk of bladder cancer and heart failure associated with pioglitazone.
<p>DPP4 (dipeptidyl peptidase IV) inhibitors</p>	<ul style="list-style-type: none"> ▶ Sitagliptin: is the preferred first line DDP4 inhibitor in Croydon ▶ Saxagliptin and linagliptin should be reserved as alternatives in patients with moderate or severe renal or hepatic impairment. ▶ Vildagliptin: not recommended for use in Croydon (CPC). ▶ Alloglitin ▼ – not yet considered by CPC / new drugs. Primary care advised not to prescribe until a formal recommendation on its use is made.

SGLT2 inhibitors (sodium-glucose co-transporter 2)	<p>Inhibits glucose re-absorption in the proximal renal tubules, leading to increased urinary glucose excretion</p> <ul style="list-style-type: none"> ▶ It is reported to produce weight loss when used in combination with metformin ▶ Common adverse events include vulvovaginitis, balanitis and related genital infections, UTIs, back pain, dysuria, polyuria, dyslipidaemia and increased haematocrit. ▶ Dapagliflozin (Forxiga® ▼) recommended following NICE TA ▶ Canagliflozin (Invokana® ▼) – not yet considered by CPC / new drugs. Primary care advised not to prescribe until a formal recommendation on its use is made.
Combination oral products	<p>Combination oral products are generally not recommended. If non-adherence suspected, consider referral to community pharmacist for Medicine Use Review (MUR).</p>

Short acting Insulins – Soluble acting insulins should be administered 20 minutes before food as they take 30 to 60 minutes to act. Their effects last for 6 to 8 hours giving greater potential for hypoglycaemia

Rapid acting Insulin analogues - Novorapid® has evidence to support use in pregnancy so may be an option in these patients

- People with glycaemic control problems should be properly assessed for underlying causes before newer, more expensive insulins are considered (including education, understanding of the disease and its management)
- Rapid acting insulin analogues have a more rapid onset of action compared to soluble insulin, and should be injected with or just after food.
- All available pen devices are equally easy to use and reliable, costs are similar

Intermediate Acting Insulin (Isophane) - These insulins are first choice in type 2 diabetes when insulin is commenced in addition to oral medication

These intermediate acting insulins are usually administered twice daily

Long acting insulin analogues should be administered at the same time each day and usually requires once daily dosing. Some patients may require BD dosing on Specialist advice.

GLP-1 receptor agents (glucagon-like peptide-1) - Exenatide and Liraglutide should only be considered as third-line therapy (in accordance with NICE CG87/TA203/TA248) when control of blood glucose remains or becomes inadequate (HbA1c \geq 7.5%, or other higher level agreed with the individual), and the person has:

- Type 2 diabetes and a BMI >35 kg/m²
- At least 2 oral hypoglycaemic agents at maximum dose.
- Those patients in whom other oral therapies/therapeutic approaches have been considered but rejected for specific reasons.

People with glycaemic control problems should be properly assessed for underlying causes before these newer, more expensive insulins are considered (including education, understanding of the disease and its management)

Bisphosphonates and other drugs affecting bone metabolism - Alendronic acid Tablet 70mg, Risedronate 35mg tablets, Strontium Ranelate 2g sachets. Weekly dose with an appropriate calcium and vitamin D supplement. The dose of the calcium supplement should be omitted on the morning the weekly bisphosphonate dose is taken.

BNF 7- Obstetrics, Gynaecology, and Urinary Tract Disorders

Combined Oral Contraceptive

Prescribe by brand name & refer to BNF comparison chart for content/cost comparison.

(low dose and 3rd generation -**note increased risk of VTE**). When offering combined oral contraceptives (COCs) first-line options are monophasic preparations containing 30-35mcg of oestrogen and either, norethisterone or levonorgestrel. However all COCs can be considered based on patient acceptance.

First choice products should be considered for new patients. Patients on existing treatments do not need to be switched.

Other versions of COCs are available and are appropriate to be prescribed including the Branded generic/equivalent versions which may be more cost effective. Check availability from local pharmacies. Also see COCs content and cost comparison table in BNF. All to be prescribed by brand name and not generic name to avoid confusion and enable patients to receive the same product each time

Oral progesterone only contraceptives (POP)

Micronor[®] should be taken at the same time each day, if taken outside a "3hr window", Levonelle 1500[®] (within 12hrs of unprotected sexual intercourse, and no later than 72hrs) should be prescribed. Cerelle should be restricted for use in patients who cannot tolerate oestrogen containing contraceptives or in whom these preparations are contra-indicated. If compliance may be an issue Cerelle can be used first line over other POPs

Transdermal patch – (Evra[®] patches) Restricted for use in women who are likely to comply poorly with COCs, or have conditions causing malabsorption

Coils: can be inserted up to 120hrs after unprotected sexual intercourse

Nova-T[®] 380

T-Safe Cu 380 only requires replacement every 10 years alternatives eg Nova-T[®] 380 require replacement after 5years.

Any other copper IUD with 375 -380 of copper can be used after clinical assessment, as long as the practitioner has been trained to fit the device. IUDs with 300 mm² should be reserved for emergency use where the IUD is to be removed at the next period. IUD should be offered to all women requesting emergency contraception

Ulipristal (EllaOne[®]) recommended where unprotected intercourse has taken place between 72 and 120 hrs ago

Drugs for genito-urinary disorders

Oxybutynin immediate release tablets are firstline choice for urinary frequency, enuresis and incontinence, but are not well tolerated in many patients. If they experience any side effects consider the modified release preparation which may be better tolerated due to sustained release of the drug.

Trospium may be a useful alternative choice in the elderly, as it doesn't cross the blood brain barrier so is less likely to cause drowsiness and dizziness

BNF 9 - Nutrition and Blood

Aim for 100-200mg elemental iron per day for treatment of iron deficiency. If not tolerated, try other salts. Avoid modified release preparations.

Enteral Nutrition (Sip feeds)- Advise acute prescribing only, not repeat.

has been used for at least 1 month prior to trial of Sip feed. Patients must have an ACBS indication and a goal for treatment. Prescribe starter/sample pack which includes mixed flavours, then agree with patient preferred flavour and prescribe these (do not prescribe more than 1 starter/sample pack per patient).

BNF10 - Musculoskeletal and Joint Diseases

Non-steroidal anti-inflammatory drugs (NSAIDs) - When using oral NSAIDs consider gastro protection in those at high risk e.g aged 65yrs and above. Consider Lansoprazole 15mg capsules or omeprazole 20mg capsules .

Caution :

Diclofenac is not to be used in patients with CV disease risk. Avoid MR preparations and potassium salt for diclofenac preparations.

Etoricoxib - monitor BP before treatment and 2 weeks after initiation and also periodically during treatment

All NSAIDs antagonise the cardioprotective effects of low dose aspirin. Using a coxib while on aspirin cancels any GI protection of coxib. Use conventional NSAID + PPI if patient is on aspirin.

Gout and cytotoxic induced hyperuricaemia

(Acute attack)- First choice is Colchicine 500mcg tablets

Dose= 500mcg 2 to 4 times a day until symptoms relieved. Max 6mg (12 tabs) per course. Course not to be repeated within 3 days

Use colchicine as an alternative where NSAIDs are contra-indicated

(Long term control of gout) – Allopurinol 100mg or 300mg tablets. Starting dose is 100mg daily. Do not start during an acute attack. Caution in renal impairment – initial dose may need to be 100mg alternate days

BNF 12 - Ear Nose and Oropharynx

Otitis Externa (Anti - inflammatory) - Prolonged use of topical corticosteroids should be avoided, Use of >5ml of betamethasone per week may need additional systemic monitoring

Treatment Advice

- Remove or treat any precipitating or aggravating factors
- Prescribe or recommend an analgesic for symptomatic relief
 - paracetamol or ibuprofen is usually sufficient, codeine can provide additional analgesia for severe pain
- Prescribe a topical ear preparation for 7 days

Otitis Externa (anti-infective) - First choice is Locorten-Vioform® ear drops. The anti-infective agent clioquinol in this product is considered a reasonable first line choice as it is not used systemically and resistance is growing to topical aminoglycoside preparations

Nasal Allergy - First choice is Beclometasone Nasal Spray 50mcg/metered dose. Prescribe 200 dose packs as more cost effective.

Second choice is fluticasone propionate nasal spray. 150 dose pack specifying branded generic Nasofan is most cost effective.

BNF 13 - Skin

Emollients - All emollients except Doublebase and liquid paraffin may be used as soap substitutes, by firstly wetting the skin, before washing with the product and rinsing off.

Once a suitable emollient has been determined for a patient then prescribe as 500g depending on the amount of coverage required.

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. For the full NPSA alert please follow this link: [Fire Hazard with Paraffin-based skin products](#).

Several of these should be tried before referring to a specialist centre.

Patients who have been discharged from a specialist centre on a particular product should be maintained on the same product when it is effective

Topical Corticosteroids -

MILD

Hydrocortisone 0.5% and 1% cream 30g, 50g

Hydrocortisone 0.5% and 1% ointment 30g, 50g

MILD with antimicrobial

Canesten HC[®] cream

Daktacort[®] cream

Daktacort[®] ointment

Timodine[®] cream

Fucidin H[®] cream

MILD with crotamiton

Eurax-Hydrocortisone[®] cream 30g OTC

MODERATELY POTENT

Eumovate[®] 0.05% cream 30g (small lesions) OTC

Eumovate[®] 0.05% ointment 30g (small lesions)

Betnovate RD[®] 0.025% cream 100g. (large lesions)

Betnovate RD[®] 0.025% ointment 100g (large lesions)

MODERATELY POTENT with urea

Alphaderm[®] cream 100g

Hydromol HC intensive[®] cream

MODERATELY POTENT with antimicrobial

Trimovate[®] cream 30g

POTENT

Betnovate[®] 0.1% cream 100g

Betnovate[®] 0.1% ointment 100g

Betacap[®] 0.1% scalp application 100ml

POTENT with salicylic acid

Diprosalic[®] ointment 100g

Diprosalic[®] scalp application 100ml

POTENT with antimicrobial

Fucibet[®] cream 30g

Synalar C[®] cream 30g

Synalar C[®] ointment 30g

Synalar N[®] cream 30g

VERY POTENT

Dermovate[®] 0.05% cream

Dermovate[®] 0.05% ointment

Dermovate[®] 0.05% scalp application 100g
